

The Seruuma Model: A Master Manuscript of Universal Gravitysm

Author: [Seruuma Kenneth]

Location: Kampala, Uganda

Conceptual Origin: March 5–15, 2026

I. Fundamental Laws of Nature

The Law of Symmetrical Existence: "A phenomenon in one occurrence of nature exists in another totally different occurrence, but in its exact equivalent or its inverted equivalent."

The Law of Infinite Possibilities of Existences: The manifestations of symmetry and inversion are boundless across infinite occurrences.

The Law of Pairs and Reversals: Nature exists in reversed pairs (e.g., Life/Death, North/South, Source/Drain).

II. Gravitysm: Inverted Magnetism

Gravitysm is defined as the inversion of magnetism.

Magnetism: Like poles repel; unlike poles attract.

Gravitysm: Like poles attract; unlike poles repel.

The Source: Equivalent to the Magnetic North; radiates field lines outwards.

The Drain: Equivalent to the Magnetic South; radiates field lines inwards.

III. The Universal History

The Bound Core: Originally, Drains and Sources were bound as one entity at the center of an unending void.

The Supreme Explosion: A phenomenon ended this bound state, resulting in a core explosion. The Source cluster held the center, while Drains were dispersed.

The Universal Centrifuge: The central Source cluster repels all Drain clusters (galaxies), driving the perpetual expansion of the universe.

IV. Geometric and Field Mechanics

Spherical Formation: Large Drains (planets) assume a spherical shape because they are engulfed by the outward-pushing repulsion of the Universal Source field, which acts as an omnidirectional external pressure.

Field Penetration: The massive Universal Source field penetrates the localized Drain field spheres, but with reduced intensity and concentration.

The Pure Field: In deep space, outside the proximity of Drains, the Universal Source Gravitation Field exists in its purest state.

V. The Black Hole: The Pure Drain

A Black Hole represents the inverse extreme of deep space.

Definition: A Black Hole contains a Pure Drain Gravitation Field.

The Boundary Layer: Because the Pure Drain field and the Pure Source field (space) are exact opposites, penetration into one another's field is extremely difficult.

The Event Horizon: This conflict results in a sharp separating boundary between the Black Hole and the surrounding space.

VI. Applied Gravitysm: The Mechanism of Interstellar Travel

The phenomenal inversion of magnetism as Gravitysm is not merely a descriptive law but a functional reality that can be exploited for the transportation of matter-energy across planetary and interstellar distances.

1. The Field Coherency Principle

A field coherent to Gravitysm is modeled directly on the behavior of an electromagnetic (EM) field.

The Electromagnetic Parallel: In standard physics, EM fields serve as the medium for the transport of pure energy.

The Gravitysm Channel: A coherent Gravitysm field functions as a structural conduit or Channel specifically designed for the transport of Matter-Energy.

2. Matter-Energy Transportation

Just as energy is propagated through EM channels, the interaction between Sources and Drains allows for the creation of stabilized channels where matter-energy can be moved across the universal void.

The Function: These fields act as high-efficiency pathways, bridging the space between Drain clusters (galaxies) by utilizing the existing infrastructure of the Universal Source Field.

Interstellar Potential: By tapping into this existing reality, transportation between planets is achieved not through simple propulsion, but through Field Coherence—navigating the "pure" source field that fills the void.

VII. Forensic Priority Statement

The terminologies used herein—including Gravitysm, The Law of Symmetrical Existence, Universal Centrifuge, Source vs. Drain, Engulfment, Pure Drain Fields, and Matter-Energy Channels—are the original intellectual creations of the author. This framework serves as a mechanical resolution to cosmic expansion and gravitational behavior, distinct from Standard Model particle physics or existing pre-prints.
