

Teleportation

The Seruuma Theory of Mechano-Gravitism (2026)

Conceptualised on 7th March 2026

Abstract

The document introduces and explains the theory of Mechano-Gravitism as derived from Electro-magnetism. Providing Mechano-Gravitism as the process through which teleportation is achieved. Illustrating how Seruuma's law of symmetrical existence is employed in mapping a desired existence onto an already existing establishment. The document explores the subatomic basis of the theory, considering such elementary units as photons, electrons, neutrons, neutrals, time, field lines among others. The document also provides Seruuma's theory of Gravitism as the true explanation for quantum entanglement. The document further introduces and explains new concepts developed within the Seruuma framework, concepts like the absolute void, conservation of mechanics, reality barrier, cosmic resistance, Perspective tax, voluton potential, among others. Key discoveries and breakthroughs include, the conditions of manifesting a voluton, a successful account of quantum entanglement, the theory of infinite possibilities, among others. In general, providing mathematical proofs and logic, the document supports the Seruuma framework on teleportation, providing the first ever, viable blueprint for teleportation.

Understanding mechano-gravitaic fields.

Law of symmetrical existence.

Life and death is symmetrical to north and south, and also symmetrical to positive and negative. Un-ending list. Symmetrical here means, a phenomenon in one existence of nature is mirrored in another existence, but also a phenomenon may apply to two different existences of nature.

From this point of view, we construct mechano-gravitism from electro-magnetism by mapping our desired existence to the already existing electro-magnetism. Then, it becomes clear how mechano-gravitism is the key to interstellar travel.

The sub atomic basis

A neutral is the form of mass that houses charge, while a neutron is the form of mass that doesn't carry charge. In the Seruuma symmetry, the neutral is like a soul while the neutron is like a body, and the two bond to form mass as experienced by science.

Birth of a photon.

For an electron to move to a higher orbit, it consumes energy. But when an electron moves to a lower orbit, it loses energy, and this lost energy is manifested as a photon.

We come to the very exact moment and instant when the photon is released, and that is the moment when the electron lands in the new orbit. At this moment the electron loses all forward motion and instantly commences on circular motion. Thus, a photon is manifested at the point and instant when an electron brakes instantly from forward motion.

Part of the kinetic energy initially possessed by the forward moving electron is what is then manifested as a photon. So, a photon is nature's way of compensating for the instant brake from motion and instant loss of kinetic energy thereof. But, the motion orientations too must be preserved, hence a photon inherits these motion orientations of an electron. So, nature preserves reality. A photon and its behavior therefore becomes natural, grounded in the natural laws of existence.

Mapping a voluton on a photon.

Based on the concept of Gravityism existing as inverted magnetism, a voluton should exhibit mirror aspects of a photon.

Comparisons

A photon is energetic in the sense of composition, while a voluton is volumetric in composition.

A photon inherits energy and motion orientations from an electron, while a voluton inherits volume and internal kinematics from a source's teleportation spheroid.

A photon is manifested when an electron comes to instant brake from forward motion, henceforth a voluton is manifested when a spheroid instantly gains velocity.

In electro-magnetism a photon travels, while in mechano-gravityism a voluton travels.

In electro-magnetism, a photon resonates perpendicular to the direction of travel of the wave, while in mechano-gravityism a voluton potential resonates parallel to the direction of travel of the wave.

Conclusion;

The comparisons demonstrate the inversion witnessed between magnetism and gravityism. It is upon this inversion that the mechano-gravitaic model is constructed.

Example,

consider an electro-magnetic wave of frequency 3GHz. The photon oscillates at a rate of 3,000,000,000 times per a second, perpendicular to the direction of wave travel. Yet, even at such ultra high frequencies of oscillation the forward speed of the wave remains constant, the speed of light.

Now, let's consider a mechano-gravitaic wave of frequency 600Hz, a much lower frequency than that of an electro-magnetic wave. This is about the frequency of vibration of most

insects, and it would be the rate of resonance of a voluton potential between destinations. Irrespective of the distance between the two destinations, this rate remains constant.

Comparison;

Literally, even in a linear sense, an electro-magnetic wave of frequency 3Ghz would take years to travel a distance of several light years, while a mechano-gravitaic wave of just 600Hz resonance would travel the same distance in a fraction of a second.

Implications;

While a photon may take several years to travel across galaxies, a voluton potential on the other hand is able to travel to and fro across galaxies several times in a single second. This means instant travel from one galaxy to another. This, is the pivot of interstellar travelling.

Natural instance;

Insects vibrate at some frequency (e.g, 600Hz) before teleporting to a destination. During this process, they broadcast a mechano-gravitaic wave from themselves as the point of origin to a distant point as the point of destination. And when they travel, they reach their destination instantly.

Just as oscillations are between the north and south poles of a magnet in electro-magnetism, vibrations in mechano-gravitysm occur between the source (such as a vibrating insect) and the drain (which is any point in the physical universe where a drain field exists.)

So long as the broadcast reaches that destination, the distance doesn't matter, travel will be instant.

Why the inversion matters.

According to the law of pairs, nature exists in inverted pairs. A Phenomenon in one existence of nature has an inverted equivalent in another existence of nature.

So, everything that is existent possesses an inversion, whether currently discovered or pending discovery.

Consider the example of the famous law of attraction, where people attract experiences into their lives which are the same as those in their predominant thoughts. Summarised as, "Negative thoughts attract negative experiences, while positive thoughts attract positive experiences." Isn't this the same as like attracts like, and unlike repel! Which is an inversion of attraction as witnessed in magnetism, where unlike poles attract and like poles repel. This therefore, is a clear example of an inversion of the phenomenon of attraction as witnessed in two different instances of existence; magnetism and human psychology.

More comparison.

In electro-magnetism, magnetism offers electron orientations (oscillations) and electricity offers electron direction (flow from high potential to low potential.) Likewise, in mechano-gravitysm, gravitysm provides for voluton potential resonance (vibrations of source against drain) and mechanics provides for manifestation of a voluton, location of the manifestation, and the order of this manifestation.

Instance;

A vibrating insect preparing for a teleportation, is existent somewhere inside the earth drain field. It then utilises the atmosphere at a certain point within earth as a distant drain against which it vibrates its source field to create a mechano-gravitaic field. With these vibrations, it has re-defined its proximity from that of solely earth drain to one of shared drain between earth and the new destination drain. At that moment, the insect is proximal to earth, but it is also proximal to the new destination point, and when the direction price is paid with the insect attempting to gain instant velocity from its current earth position towards new destination position, the insect then instantly ceases to exist at the old position while simultaneously coming into existence at the new destination position. So, the insect has teleported from previous earth position to new earth position.

The voluton that teleports everything inside the insect's spheroid only manifests at the instant of attempted movement / teleportation. And the travel is instant, so the voluton is actually theoretical and can never be seen with eyes. It is just the volumetric shift in domains. The local domain, where the spheroid is initially located and the destination domain, where the spheroid newly comes into existence. A domain being the definition of the universe as observed from that point.

Modelling.

A phenomenon in a desired occurrence is modelled on a phenomenon from some other already existent occurrence.

Implication;

To construct a new completely different occurrence, which is until the moment non-existent, we select an already existent occurrence which behaves much like the one desired, then with the law of symmetrical existence, we model the new occurrence to the existing occurrence.

In this process of modelling, we match phenomena and inverted phenomena in the two occurrences. That is to say, a phenomenon known to apply to the existing occurrence is exactly imposed onto the desired existence, or its inverted equivalent is imposed instead. It's a kind of mapping one existence onto another through a shared phenomenon or its inverted equivalent.

This is how the Seruuma Model arrives at the theory of mechano-gravitysm.

When the mapping is complete, the desired occurrence then comes into existence. This implies that it is impossible to exhaust the number of occurrences that may be modelled into existence, after all, the newly acquired existence then becomes a reference for future modelling. This forms the law of infinite possibilities.

This infinity of possible occurrences also stems from the fact that nature possesses an infinite number of phenomena. And this applies to all aspects of existence, not just science and mathematics.

An era of infinite possibilities

The law of symmetrical existence, when viewed in this perspective, ushers humanity into a new era, the era of infinite possibilities, where everything and anything is truly possible and may indeed be constructed into existence.

Symmetry and evolution

This law is ancient, that is why nature has managed to create an infinite number of occurrences. Isn't it the same law through which evolution operates! Through which evolution maps one species onto another, and certain behavioral traits onto others!

Life and death

With the law of pairs, and the law of symmetrical existence, death may truly transition to life, just as life transitions to death. Life can be restored into the dead. It's just a matter of reversing the sequences that lead to death. Phenomena everywhere!!

The future of teleportation.

This Seruuma concept of interstellar travel will over time be refined by scientists, much like a chariot was refined into modern cars and a kite into aeroplanes.

The mechanics of teleportation

Anchoring a destination.

The beauty of the Seruuma theory and concept of interstellar travel comes in utilising the always available, everywhere present, source field of the universal centrifuge. This Field, which emanates all points of the expanding universe, originates from the universal centrifuge at the center of the universe, which standard science recognizes as dark matter. This universal source is what continues to repel the universe's drains outwards.

The universal source field permeates drains themselves and therefore exists within the drains but in quite diminished intensity, much like sunlight rays inside an opaque liquid.

Outside the drain field proximity, like in deep space vacuum, the universal source field intensity is highest, and it is lowest inside a black hole.

Source field inside earth

The universal source field in earth's atmosphere is much more intense than the universal source field inside earth's crust. The crust is a stronger drain than the atmosphere, therefore it repels the universal source field more strongly. For this reason, insects more regularly teleport through the atmosphere than through walls.

Also, consider the difference in air density within layers of earth's atmosphere. Insects exploit the very low density of high altitudes to perform long distance teleportations, compared to the high air density of low altitudes. So, as air density approaches a vacuum (moving higher into the atmosphere), the distance that may be covered in one single teleportation, tends towards infinity. In a pure vacuum, this distance is infinite.

Field bonding

During teleportation, the teleporter bonds its source field with the universal source field which is omnipresent and reaches everywhere.

The teleporter's mechano-gravitaic vibrations therefore are propagated along this field line, and because it is far reaching, the extent of propagation will only depend on the magnitude of the vibrations and the drain fields in between, which by default weaken the strength of this broadcast.

The teleporter will only reach as far as the magnitude of the wave will take it, given the obstructing drains in between. The same magnitude of a wave will reach different distances depending on the nature of drain obstruction along the broadcast path. For example, a broadcast through a wall will take an insect a shorter distance than a broadcast through the atmosphere, or vacuum, given the same magnitude of wave.

The wave magnitude is a function of amplitude and power, with this magnitude the wave can only penetrate so far into drains along the channel, before eventually braking, and getting deflected back.

The cosmic medium

From this perspective therefore, the Universe is a single drain field with a non-uniform, varying, dynamic pattern of drain field intensities, where some regions are more intense than others.

Deep space vacuum is zero distance on this drain universe map. The extent to which a broadcast penetrates this deep space is infinite, so it does not stop penetrating because the space does not resist or repel the source field.

A penetration through a drain field will eventually be braked and deflected back.

Scenario:

For two planets with atmospheres, separated by pure vacuum with no drains in between, an insect finds it easier to teleport from one planet's atmosphere to another, than to teleport through a single planet's hill, irrespective of the distance between the planets. To the insect, the two planets have their atmospheres physically joined together in the mechano-gravitaic sense.

Again, this is the reason why insects normally teleport in staccatos rather than making a single long distance teleportation. They are literally avoiding denser drain paths and changing direction towards a less dense path, while maintaining their effective direction of travel. A staccato chain teleportation is therefore more energy efficient.

Teleportation channel

Repulsion, braking and eventual deflection of a broadcasted mechano-gravitaic wave results in a standing wave formed in between the broadcasting source and the destined drain.

Hence the formation of a teleportation channel

Quantum entanglement.

The two spinning particles that standard science determines to be quantumly entangled are indeed bonded by their gravitation fields.

Because the connecting field line is inelastic in nature, stopping one particle would inevitably stop the other, irrespective of distance between them because of the far reaching nature of the universal source field which acts as the joint connecting the individual source fields of the two spinning particles.

This is how the Seruuma theory bridges the gap. Explaining why the entangled particles should be spinning for the effect of distance to cancel out.

In the none spinning state, bonding their fields is effected by bringing the particles very close together into each other's drain field proximity so that their drain fields naturally bond. Again here, the Seruuma theory acts as a bridge, explaining why this bondage (entanglement) should happen in very close proximity and in a vacuum. Ensuring that there is no other drain in between the two particles, that may interfere with this bonding field. Even an air molecule is considered a drain within the Seruuma framework.

The process of quantum entanglement is therefore a process of bonding two drain fields or bonding two source fields.

Following the law of pairs, where nature exists in inverted pairs, as witnessed in the spinning neutral-neutron pair of the universal source, it is only logical that a successfully entangled pair of particles experiences an inversion of properties. Hence two spinning, quantumly entangled particles, once forced to stop, will be observed to exhibit opposite states.

Consider the spinning neutral - neutron pair forming the universal centrifuge, if forced to stop, the two are observed as a pair of inverted masses. This is because the two inverted masses are quantumly entangled, by the absolute void which primarily collapses them into itself. This is yet another major breakthrough reached by the Seruuma theory.

Worthy of noting, is when i received the realisation that a voluton is manifested as a result of tendence for a volume to instantly move in a given direction. This, happen on the 11th of March, year 2026. And I thereupon, recorded the realization in my notebook.

Prior to this date, I had been puzzled by the question of how a non-physical entity, which is referred to as a voluton, would manifest from a physical entity of mass - energy densities.

Then, on the eventful 11th of March, I finally understood how this happens. It's in the inversion of the phenomenon of electro-magnetism.

In electro-magnetism what is transmitted is the non-physical energy, a photon, and an electron is the bridge that aids this transition from physical to non-physical energy. An electron acquires kinetic energy (physical) and upon instantly stopping, which is the same as instantly losing kinetic energy, a photon is manifested as nature's way of preserving energy. The reverse is true as witnessed in solar panel technology.

So, kinetic energy changes to photons, by instantly braking moving electrons. The inversion of this would imply that kinetic energy becomes a bridge that aids the manifestation of a physical electron into a non-physical electron. This manifestation of course being of volume. From a physical volume of an electron to a non-physical volume of an electron, just by making the electron volume instantly gain velocity. And the reverse is true. This however, only applies to a volume of a source field as already discussed. Thus in summary, both kinetic energy and electrons bridge each other's transition, and both manifest non-physical states. Kinetic energy - to - photon, and volume - to - voluton. Voluton manifestation is not limited to an electron, as anything with volume may manifest its equivalent voluton, but it is the electron volume that is used to reach this logic of voluton manifestation.

Scenario;

For an insect vibrating inside a tele-bubble, to manifest a voluton and therefore teleport, it should instantly fire into motion from rest, towards a targeted direction. This instant step into super motion from rest breaks the reality barrier and enables a transition from physical volume to a non-physical volume.

Conservation of internal kinematics

Remember, a photon inherits its orientations from its parent electron, and likewise a voluton inherits its internal kinematics from its parent volume.

Conservation of mechanics.

Similar to the law of conservation of energy, the mechanics of existence too must be conserved by nature.

The Cosmos resistance

In linear motion, a body covers a determined distance at a particular velocity, in a given period of time. This is the price of occupying a new position from an old position within the physical universe.

The price; distance, motion, direction and time forms a barrier of reality, the resistance experienced in traversing the cosmos as a medium.

Proximity

When proximity is re-defined through mechano-gravitaic resonance, physical distance becomes bridged, and the distance price fully paid, but only along the mechano-gravitaic field. With this bridging, cosmos resistance is nullified, because distance has already been covered by the resonating source field and no more coverage of distance is needed for this performance to continue.

A ship transitioned into a source, and generating a source field volume (tele-bubble), upon creating a mechano-gravitaic channel enters a state where it shares proximity with two different positions. But the ship being still in the physical volume can only exist at the initial position, with a price to pay if it were to change locations. This price would be motion, direction and time, unless the ship transitioned to a non-physical volume, the voluton, which by nature exists everywhere. Since the ship is the generator of the tele-channel, it is inherently connected to the channel.

With its proximity re-defined to also encompass new destination, the distance price is paid, and so is time price. Now to complete the payment of the price, the ship would simply attempt to move quickly from initial location to new location, and it will be there, because distance was already paid, as well as time and it was no longer necessary for the ship to move physically to reach the new location. This is why I call the resistance a reality barrier, because only after all taxes are paid does the new reality of occupying the destined position come into being.

The ship doesn't move across the distance in the literal linear sense, it simply ceases to exist at an old location while simultaneously coming into existence at a new location.

Nature conserves these mechanics involved in changing physical locations through the manifestation of a voluton, in the same way that it conserves energy through the manifestation of a photon.

The absolute void.

As the name indicates, the absolute void contains nothing, not even time and dimensions, not even vacuum because vacuum comprises dimensions and time.

The void, therefore assumes that which it contains. Nothing less, nothing more. The volume of the void is the volume of its constituents, the time of the void is the time its constituents are accustomed to, among other aspects of existence known and unknown. Whatever occupies the void is what offers it form. Otherwise, it has no form. If all its constituents were to exit, the void would indeed remain void of form and absolutely empty.

The physical, expanding universe is inhabited inside the absolute void. If a bite of volume at any domain of the physical universe is momentarily taken out of the void, this volume literally ceases to exist anywhere within the physical universe. So, it is not anywhere within the dimensions of the physical universe. But, this does not leave a void hole in the universe, as this would mean that the absolute void has a volume. The physical universe would simply cease to account for this bite in all aspects of existence. Then later, if this same bite of volume was to be placed back into the physical universe, it would literally be accepted anywhere within the dimensions of the physical universe. It would be as if it is an entirely new entity into the universe. The newly accorded location within the physical universe is accepted and accounted for as the true positioning of this bite of volume. The bite's original kinematics becomes the kinematics of this new locality, while the bite's perspective in respect to the universe becomes this newly defined perspective. The bite lost its former perspective when it was taken out of the universe. It only retained its internal kinematics. This bite may only be taken out of the physical universe and momentarily out of the void as a voluton. This is why, a voluton is not anywhere inside the physical universe but it's also everywhere inside the physical universe at the same time. This is because, nothing can ever truly exit the absolute void. So, a voluton borders between existence and non-existence. This phenomenon of simultaneous existence and non-existence of a voluton, is what makes teleportation possible. It is based on the concept of an absolute void which contains everything known and unknown.

Since a voluton exists no-where within the physical universe, a bite volume can be extracted from anywhere within the physical universe. And since a voluton exists everywhere within

the physical universe, a bite volume can be implanted anywhere within the physical universe. This is what is accomplished during teleportation as laid out in the Seruuma Model.

Observed scenario:

Insects vibrate through the cosmic medium, nullifying the cosmic medium resistance and there upon achieving teleportation. This resistance is overcome first by re-defining proximity, and then by paying the motion-direction price, which naturally collapses the reality wall, enabling instant teleportation from one location to another within the universe.

Why teleport everything inside the tele-bubble.

Recalling the subject of gravitation masking, a source field masks a drain field to produce a resultant that is either effectively drain field or source field. This is how the centrifugal outpush of an electron masks the primary inward pull from a void, to produce an atom that is effectively a drain. While the centrifugal outpush in a spinning neutral-neutron pair out weighs the inward pull from the void to produce a source. In the same manner, the source field of a tele-bubble effectively masks the drain fields of all its constituents, producing a composition that is effectively source.

Just as the neutral-neutron pair spins at the verge of exiting the void, every source exists at the verge of exiting the void. This is because the source's outpush has completely masked the inward pull from the void.

Pole based Resonance

Resonance between source and drain – the source vibrates against the medium. Amplitude of vibration represents how deep the source field penetrates a drain field. (Thus, amplitude is a representative of magnitude)

Inside Earth drain proximity, the Universal source field is naturally weakened. But presence of a powerful natural source field such as a tornado, amplifies the universal source field, thereby facilitating insects'

capacity to teleport much longer distances within earth's atmosphere. (In other-words, the amplified universal source field increases gravitation permeability of earth's inhabitant drains within the proximity of the amplified field.)

Permeability of Space

Deep space without any drains, has absolute Gravitation permeability and as a result, a source field readily penetrates deep space without any resistance. Therefore, the depth of penetration by a resonant wave is determined by its amplitude and power.

Example: For a fly vibrating between Earth's atmosphere and the atmosphere of a distance planet, the distance penetrated by the vibrations is actually the distance from the insect's fore-most point of its head to the outer most extent of earth's atmosphere plus the distance from outer most extent of distant planet's atmosphere to the destination point within the planet's atmosphere. Any drain in-between the planets, along this path of vibration, contributes to the distance penetrated by the vibrations.)

Thus, in terms of source field resonant vibrations, the Universe is as a single drain medium with a dynamic pattern of varying gravitation permeability, and without any deep space. A teleporting insect is shifting positions within this drain medium. To the insect, movement is not across planets, but rather through a medium of varying gravitation permeability. By vibrating with different wave magnitudes and choosing a particular direction (path), the insect determines the extent to which it penetrates into this medium. This becomes the distance of its teleportation.

Thus, penetration distance is directly proportional to the gravitation permeability of the penetrated drain.

Understand space; With an absolute permeability, space possesses an infinite penetration distance and consequently, an infinite teleportation distance. If along a path of vibration there is space, on the drain medium map, this space does not exist, and the apparent teleported distance is the depth of penetration into the medium. In truth, the teleported distance includes the space distance.

A given magnitude of vibration will travel varying distances, depending on the permeability of the drain being penetrated.

A Universe of Domains.

A domain is a definition of the universe and perspectives as experienced from a particular position within the Universe.

Teleportation involves a local domain (based on the current location) and a destination domain.

Cosmic medium resistance

Reality is framed in perspectives. To overcome the reality barrier, perspective tax must be fully paid. Otherwise, nature upholds the existing reality. This perspective tax is also the medium resistance of the cosmos.

Traversing the cosmos means gaining different perspectives of the universe. And like a fish traversing water, cosmic traversing too works against resistance. Only that the nature of resistance differs.

One of the ways to gain a new perspective at a new position of the universe would be to travel linearly there. And the cost of achieving this would be distance, time, direction, and movement (kinetic energy). After the cost has been fully paid, the universe is then experienced as viewed from this new position.

It's worth noting that since linear travel expends time, the newly gained perspective will exclude the time that was earlier expended to reach the position. This implies that the traveller experiences the passing of time, and will never gain the perspectives of the new position which occurred during the course of travelling to the new position.

Another way to gain the new perspective would be to teleport to the new position. Because teleportation nullifies medium resistance, the traveller never experiences a passing of time while travelling to the new position, because there is no passage of time.

First, the distance tax is paid when proximity is redefined through the source field. The reality at this moment is that the source field of the unitary source is in direct proximity (contact) with the drain field of the destination drain (e.g, a distant planet), and at the same time it is in proximity with the drain (earth) in which the unitary source is currently located. So, field-wise, there is no longer any distance between the insect and its destination point. This is the payment of the distance tax. This also explains why a body not covered in a source field will not teleport. It's the fields that cancel out distance.

Also, the time tax is paid by the field. Time has already been expended to propagate a pulse of wave from the insect to the destination point (this is the redefinition of proximity), creating a standing wave (teleportation channel.) No more time is required for the field to travel this distance because it already covers the entire distance, only the act of maintaining the teleportation channel. So, time tax is also paid. Again, this applies only to the source field, not an object that isn't effectively masked by a source field.

Then, by attempting to fire into motion towards the destination, the direction price is also fully paid. But also, this attempted motion means that mechanically the source has shifted from its current location to the destination position. At least this is what would have happened if the other perspective taxes had not been paid. But, for this payments, rather than destroying the natural order of these physical mechanics by forcing the unitary source to move towards a destination that it already occupies as a field, nature conserves the mechanics by simply collapsing the source into a voluton which simultaneously exists at the destination position, and is able to instantly re-manifest the source at this new position. This conservation of mechanics is similar to conservation of energy. Nature does not destroy energy, but it simply changes it into another applicable form. Likewise, nature does not destroy the dynamics of mechanics, it simply changes the dynamics to accommodate another applicable form.

In summary;

Redefining proximity pays the distance tax, the time tax, and the direction tax. An attempt to travel towards the destination pays the motion price, collapsing the source into a voluton which instantly remanifests the source at the destination. Manifestation of physical from non-physical occurs only when there is a tendency to stop, just as manifestation of non-physical from physical occurs when there is a tendency to move. It is a reversal. This is why teleportation utilises a source as launch and a drain for landing (braking).

While in source state, the insect is not fully grounded into the physical, and it possesses an inherent voluton potential which it may utilize at will to execute a teleportation.

A gravitation standing wave offers a channel along which the perspective tax has been paid, and as a result, the cosmic medium resistance has been overcome, or nullified, much like air resistance is nullified inside a spheroid cylinder (Tele-bubble.) The cylinder also nullifies cosmic medium resistance so that anything inside it experiences zero medium resistance.

The physical Universe is volumetric in nature, and upon occupying the absolute void it forms a volumetric cosmic medium.

The physical expanse of the Universe gives rise to physical positions. These positions cause orientations, distances, directions, perspectives, etc.

Occupying a domain within the physical Universe is to gain a physical perspective of the Universe in regards to that physical position occupied at that particular moment. Time is experienced as a result of this

occupation. Time therefore, is another variable of perspective. In other-words, everything is happening within a

time-frame as viewed from this position. Within the physical Universe, all events occur within the same instant of time. Or, rather more

accurately, all domains exist at the same instant of time. Time perspectives begin at that moment when a domain is occupied.

For example, when occupying a position within the universe, perspective defines how long when travelling at a specific velocity, would take to reach this position from different far positions. But from the same far positions, it would take completely different times to reach another position within the universe, considering the same velocity as in the first instance. In both positions however, occurrences share the same instance of time. For example, something may be happening at one position while at the same time something else is happening at another position. These two happenings at the two different positions share the same instance of time.

All positions within the Universe share the same instant of time, and occupying a domain at that Instant means that all the proceeding time is experienced as measured from that domain.

A ship creates a teleportation channel between planet A and planet C. An observer between A and C

sees nothing because they are within the separation distance and along the channel there is no distance.

Planet A, is literally on planet C.

Light travelling across the teleportation channel.

Example; when an insect at position D creates a gravitation teleportation channel to position E, the point of access of the channel is the plane right before the insect's head, and the plane of Repulsion at the destination drain position. At either planes, an attempt to move towards the other plane results in

an instantaneous manifestation of an equivalent voluton which instantly manifests a physical equivalent at the other end. Light is always in motion, moving towards a given direction.

When it reaches these planes, it automatically generates its voluton equivalent which then manifests light at the other plane. Hence, a voluton does not travel through a linear coverage of distance because it travels no distance. A voluton simply occupies space and ceases to occupy space across a gravitational channel.

Understanding gravitation coupling.

Just as two or more drains bond fields when in proximity, so do two or more sources when in proximity. An insect for example, upon transitioning to a source, because of being in proximity with the Universal Source Field, instantly bonds fields with the Universal source.

The Universal source Field is everywhere at all times. This is how the insect connects to all distances at the same time. It only focuses in a specific direction to teleport.

The absolute void

The absolute void has no dimensions. It has nothing. It only assumes the volume and dimensions of its occupants. Just like water assumes the shape of its container. Even deep space is not an absolute void

because it possesses distances. Deep space is therefore an occupant of an absolute void.

Time itself is an occupant of the absolute void. Thus, the time of the void is the time its occupants are accustomed to, in itself, the absolute void has no time. Without any occupants, the absolute void is empty and without time.
